

Assessment Task 3: Project Portfolio

AT3 - Assessment Task 3: Project

Portfolio

ARCH3372

COURSE LEARNING OUTCOMES

Upon successful completion of this course, you will be able to:

CLO1: Demonstrate an understanding of the interrelationship between architecture and technology through design.

CLO2: Select appropriate structural and constructional systems for a multi-storey residential.

CLO3: Communicate the impact of structural systems on the plan and section of a building.

CLO4: Examine strategies for arranging / placing technical systems within a building volume.

CLO5: Analyse the role of the National Construction Code, relevant Australian Standards and their application in the design of a multi-storey residential building.

CLO6: Communicate the interrelationship between technical systems.

CLO7: Produce researched and resolved designs through various drawing and modelling techniques.

This assessment task core includes competencies included in the Architect's Accreditation Council of Australia (AACA) 2021 National Standard of Competency for Architects. Through successful completion of the assessment task you will have demonstrated the following performance criteria:

PC2 - Understand the role of quality assurance systems in facilitating efficient and timely delivery of architectural services.

PC10 - Understand the whole life carbon implications of procurement methods, materials, components and construction systems.

PC12 - Understand how relevant building codes, standards and planning controls apply across architectural practice, including climate change implications, the principles of fire safety, and barriers to universal access.

PC13 - Have knowledge of documentation processes that facilitate project delivery appropriate to selected procurement processes.

PC24 - Understand how to identify and evaluate project development options in response to a project brief – its objectives, budget, user intent and built purpose, risks and timeframe, including environmental sustainability considerations.

PC28 - Be able to draw on knowledge from building sciences and technology, environmental sciences and behavioral and social sciences as part of preliminary design research and when developing the conceptual design to optimise the performance of the project.

PC30 - Be able to explore options for siting a project, including integrating information and analysis of relevant cultural, social and economic factors.

PC31 - Be able to identify, analyse and integrate information relevant to environmental sustainability – such as energy and water consumption, resources depletion, waste, embodied carbon and carbon emissions – over the lifecycle of a project.

PC32 - Be able to apply planning principles and statutory planning requirements to the site and conceptual design of the project.

PC33 - Be able to investigate, coordinate and integrate sustainable environmental systems – including water, thermal, lighting and acoustics – into the conceptual design.

PC35 - Understand the operational and embodied carbon implications of chosen materials, components and systems.

PC36 - Be able to apply creative imagination, design precedents, emergent knowledge, critical evaluation and continued engagement with Aboriginal and Torres Strait Islander Peoples to produce a coherent project design. This should be resolved in terms of supporting health and wellbeing outcomes for Country, site planning, formal composition, spatial planning and circulation as appropriate to the project brief and all other factors affecting the project.

PC39 - Understand how the integration of material selection, structural and construction systems impacts on design outcomes.

PC40 - Be able to resolve and present a coherent detailed design solution within necessary timeframes to obtain client and stakeholder approvals.

PC44 - Understand the roles and types of relevant consultants and suppliers as well as applicable construction terminology

PC45 - Understand processes for selecting materials, finishes, fittings, components and systems, based on consideration of quality and performance standards, the impact on Country and the environment, and the whole life carbon impact of the project.

PC46 - Understand the processes for producing project documentation that meets the requirements of the contract and procurement procedure and complies with regulatory controls, building standards, codes, and conditions of construction and planning approvals.

PC47 - Be able to complete and communicate on-time, accurate documents for relevant stakeholders, including drawings, models, specifications, schedules and construction documentation.

PC55 - Understand methodologies for record keeping, document control and revision status during the construction phase.

AT3 – Assessment Task 3: Project Portfolio

AT3.1 – BUILDING SYSTEMS BRIEF (Week 7)

Putting yourself in the client position for a change, you are to provide a written & diagrammatic design brief for the implementation of a building services strategy for your building. This is to be defined through a series of plan diagrams and a written brief. The brief needs to explore the proposed heating, cooling, ventilation, energy, water and waste systems for the building which in turn will be described in your drawing package. Include analysis of the whole of life carbon implications of your chosen systems. Consider previously researched Section J requirements as well as ideas around regenerative and net-zero environmental systems as part of this brief and research.

Applying this Information

The findings from the research will need to be clearly evidenced in your final drawing set. For example, if you have proposed a mechanical ventilation system, for your building you will need to show the location of the mechanical unit and any associated ventilation grilles in your drawings.

What to Submit

Each group should present a minimum of 3 x A3's (landscape folio format), with the view that research is to be shared with other students in the class. Include relevant planning information in the form of text, images, diagrams, plans, etc.

What to present in class

Each group should present the full Building Systems Brief in a clear, concise and timely manner. Each group member needs to partake equally in the verbal presentation. Presentation time: max 10min.

This task addresses the following competency standards: PC10, PC24, PC28, PC31, PC33, PC35, PC44, PC47, PC45

AT3.2 – LIGHTING AND ACOUSTICS BRIEF (Week 8)

You are to provide a written & diagrammatic design brief for the implementation of a conceptual lighting and acoustic strategy for your building. This is your opportunity to put yourself in the clients position and devise a functional and aesthetic brief for the buildings lighting and acoustics requirements. The brief will be defined through a series of plan diagrams and a written text, and then evidenced in the final drawing set.

The lighting brief needs to explore the proposed lighting strategy for the internal and external artificial lighting, including interior public, commercial and apartment lighting. You will need to research current locally sourced products to be implemented into your project.

The acoustics brief needs to identify requirements for acoustic attenuation between occupied spaces (i.e. between the apartment and corridor space) as well as internal/external spaces (i.e. build facade to apartment spaces) for occupant comfort. The acoustics brief may identify different acoustic requirements for different spaces based on occupant needs. You will need to research current locally sourced products to be implemented into your project.

Consider previously researched Section J requirements as well as ideas around regenerative and net-zero environmental systems as part of this brief and research.

KEY POINTS:

Hard surfaces reflect sound
Soft surfaces absorb sound
Rough surfaces disperse sound
Air lets in unwanted sound
Ornaments diffuse sound
Curves focus sound waves to audience

MATERIALITY:

The thicker and more dense a wall is, it is better at blocking and reflecting sound. Double wall construction is typically used to keep unwanted noise out of an area.

Concrete is beneficial for these exterior walls, but for interior walls, the porous nature creates unwanted sound reactions. It absorbs mid and high sound frequencies, while reflecting low frequencies. To aid this, concrete can be painted to fill in the holes, hence resulting in a smoother surface that will reflect the higher frequencies better.

Metal absorbs sound, creating a rattling noise. Using rubber can dampen this effect.

Plaster/Gypsum has to have a thicker depth, between 40-50 mm, so that they don't vibrate, as this will absorb low frequencies. Consequently, there will have to be more structural support as a result of the thicker plaster sheets. Fibreglass reinforced gypsum is typically used, as it has an ideal thickness.

Timber must be used correctly to provide good acoustics. If it is too thin and air behind it, say using timber battens, panel vibration will be the outcome, as well as it absorbing low frequencies.

An open grain in timber diffuses sound better, which breaks up sound waves and reduces a focal point for noise. Ideal for sound distribution. A tighter grain is more reflective, creating great clarity and projection.

A higher moisture content in the timber will cause a dampen on sound vibrations as well.

The ideal reverberation time is between 15-25 seconds
While sounds needs to reflect, too many harsh surfaces can create reverberation. Acoustic panels and upholstered chairs can prevent this effect.

SCULPTFORM:

Sculptform will provide our interior cladding, as we aim to use their batten system along walls and ceilings. The spotted gum option would be ideal, as this wood is quite dense and known for its great sound reflection.

Spotted Gum has a Durability Class 1 (AS 5604).
Acoustic Backing panels are Group 1 Fire rated.
The acoustic panels can replace a plaster wall or paint, saving costs and time.

Lighting can be incorporated into the panelling as well, in between custom made gaps or layered on top of the timber battens.

Optional acoustic batts for improved acoustic performance

Typical stud wall (maximum stud centres 600mm)

Mounting track centres:
Timber typically 600mm, aluminium typically 1200mm in interior applications.

Refer to project specific engineering documents and our product technical datasheet.

Standard mounting track

Feature batten

Acoustic backing

Applying this Information

The findings from the brief and research will need to be clearly evidenced in your final drawing set and specifications. For example, if you have proposed a particular feature light for the buildings entry foyer you will need to show the location of the light along with a reference code in your drawings that links to the product specification in the Material and Product Schedules (AT3.3).

What to Submit

Each group should present a minimum of 3 x A3's (landscape folio format), with the view that research is to be shared with other students in the class. Include relevant planning information in the form of text, images, diagrams, plans, etc.

What to present in class

Each group should present the full Environmental Design Analysis Report in a clear, concise and timely manner. Each group member needs to partake equally in the verbal presentation. Presentation time: max 10min.

This task addresses the following competency standards: PC10, PC24, PC28, PC31, PC33, PC35, PC44, PC47, PC45

AT3.3 – MATERIALS SCHEDULE (Week 8-12)

You are to provide a materials schedule as part of your documentation package. All materials are to be clearly tagged, scheduled, and referenced in terms of their specification including material or product name, finish, code, supplier, dimensions, cost, etc.

IMPORTANT: Your research will include first nations materials, suppliers and construction methods. **You will need to consider and calculate the percentage of the structural and external cladding materials being proposed that are sourced from country or a wider context.** The buildings' structure could also reference country, i.e. could the idea of trees inform a structural grid? As part of your research you will need to create a visual map of first nations material origins/sources.

FLOOR FINISHES

	Bathroom Floor Tiles Bathroom floors All levels	WHITE SQUARE SATIN MATT FLOOR TILE PAT503 Tile Warehouse	100	100	-	Tile Warehouse Distributors
			Width (mm)	Length (mm)	Depth (mm)	
	Timber floorboards Classrooms Level 1-4	Ash Classic 250-350mm 1-Strip HW8700 Havwoods	350	4000	20	Havwoods Distributors
			Width (mm)	Length (mm)	Depth (mm)	
	Carpet Collaboration zones and screening rooms Basement-level 9	Agua 5300 Feltex	-	-	7	GH Commercial Distributors
			Width (mm)	Length (mm)	Depth (mm)	
	Concrete floor Open areas All Levels	Product Name of Material Product code Brand	000	000	000	Distributors name Distributors
			Width (mm)	Length (mm)	Depth (mm)	

Applying this Information

The findings from the research will need to be clearly evidenced in your final drawing set and specifications. For example, if you have proposed a particular external cladding material for your building you will need to show the location of the cladding along with specific, dimensionally accurate constructional or fixing details in your drawings.

What to Submit

Each group should present a minimum of 6 x A3's (landscape folio format), with the view that research is to be shared with other students in the class. Include relevant specifications such as material or product name, finish, code, supplier, dimensions, cost, etc.

What to present in class

The Materials Schedules **do not need** to be formally presented in tutorials.

This task addresses the following competency standards: PC10, PC35, PC39, PC45, PC47

AT3.4 – FURNITURE, FIXTURES AND EQUIPMENT (FFE) SCHEDULE (Week 8-12)

You are to provide a FFE schedule as part of your documentation package. All furniture, fixtures, propriety products and systems are to be clearly shown in the drawing set with codes that are cross referenced back to the FFE schedule.

Applying this Information

The findings from the research will need to be clearly evidenced in your final drawing set and specifications. For example, if you have proposed a particular hand basin to be installed in the apartment ensuite you will need to show the location of the hand basin in your drawings.

What to Submit

Each group should present a minimum of 6 x A3's (landscape folio format), with the view that research is to be shared with other students in the class. Include relevant specifications such as material or product name, finish, code, supplier, dimensions, cost, etc.

What to present in class

The FFE Schedules **do not need** to be formally presented in tutorials.

This task addresses the following competency standards: PC10, PC35, PC39, PC45, PC47

AT3.5 – PROJECT PORTFOLIO DRAWING SET (Week 7-12)

You are to provide weekly iterations of your proposed design in the form of Architectural Drawings that are tested and explored 3 dimensionally. These drawings are to be developed on a weekly basis through REVIT 2026.

BUILDING PERFORMANCE CHECK

As you develop your project in Revit you will need to continue conducting Building Performance checks using Enscape Impact each week and present in class as part of your Assignment drawing package. As the design and detail of the Revit model develops you will likely see shifts in the Building Performance. This is an opportunity to analyse what causes these shifts and address accordingly.

Be mindful of the information you are analysing in Enscape Impact - you only really need to analyse the proposed building, not the surrounding context, trees, etc. A clean, simplified Revit Model will be a lot quicker and more accurate to run the Building Performance analysis. Tip: set up a specific 3D perspective view called '3D View Impact' or something similar so you can fine tune what 3D geometry is included in the analysis.

The 'in-progress' Project Portfolio drawings required are as per the minimum list below, presented to class in weeks 7-11. All drawings need to include a Revision in the Title Block including Revision Number, Revision Name and Revision Date. The final drawing set is to be presented in the Week 12 tutorial.

All drawings are to be prepared on A1 landscape format

A000 - Title Sheet

A001 - Site Plan 1:200

A100 - Basement Plan 1:100 (if required)

A101 - Ground Floor Plan 1:100

A102 - Typical Unit Lower Level Floor Plan 1:100

A103 - Typical Unit Upper Level Floor Plan 1:100

A104 - Roof Plan 1:100

A105 - Typical Unit Level Reflected Ceiling Plan 1:100

A200 - Elevations – North and East 1:100

A201 - Elevations – South and West 1:100

A300 - Section A 1:100

A301 - Section B 1:100

A302 - Section C 1:100

A303 - Section D 1:100

A400-A405 - Typical Façade/Construction Details 1:10

A500 - Typical Accommodation Unit Floor Plan & Reflected Ceiling Plan 1:20

A510 - Typical Accommodation Unit Internal Elevations 1:20

A600 - 'Special' Drawing axonometric / perspective, façade detail, structural diagram or services diagram

A700 - Building Performance

This task addresses the following competency standards: PC2, PC10, PC12, PC13, PC24, PC28. PC30, PC31, PC32, PC33, PC36, PC39, PC40, PC45, PC46, PC47, PC55

What to Submit

The final Project Portfolio drawing package should be presented as a bound A3 landscape PDF. The drawings are to be ordered alpha-numerically and each drawing should contain the Revit drawing revision 'Project Portfolio Issue' dated on the day the drawings are presented. **NOTE: FINAL REVIT 2026 MODEL IS TO BE SUBMITTED WITH YOUR FINAL PORTFOLIO**

What to present in class

Each group will present the the in-progress Project Portfolio drawings drawings in weeks 7-12 in a clear, concise and timely manner. Each group member needs to partake equally in the verbal presentation. Presentation time: subject to time availability within each class.

Note: The Week 12 class presentation is an important milestone, an opportunity to present your almost complete assignment. All group members are expected to attend and partake in this verbal presentation that forms part of the assignment assessment.

ASSESSMENT CRITERIA

The assessment criteria is to be read in conjunction with the subject's rubric. Drawings shall be prepared in accordance with established drafting standards, labelled with notes, detail and section tags, title block etc. and cross referenced.

They may be prepared using REVIT.

The drawings should demonstrate application and achievement in the following areas:

- Process, depth of research and investigation. Sourcing and synthesis of trade information, construction standards and regulations.
- Knowledge of design development aims, methods and outcomes. Management of production and content of drawings and other documents.
- Systems understanding of structural, constructional, servicing and environmental systems, influences on decision-making and relevant application to particular design project. Identification and refinement of design-specific architectural details and systems.
- Appropriate choice of materials.
- Presentation, a high standard of skill and care in REVIT.
- Knowledge and utilisation of drawing standards. Recognition of the communication role of drawings.

WORKLOAD FOR STUDENTS WORKING IN GROUPS OF TWO

Students are only permitted to work in groups of two strictly with Course Coordinator prior approval.

Below is the workload for students working in groups of two:

[AT3 - Group of 2 Workload-1.pdf](#)

SUBMITTING YOUR ASSIGNMENT

Submission Date – 5pm, Friday 16th October 2026

All students are to upload their mid semester drawing package to Canvas by no later than the Submission Date. It is a group work but EACH student is to upload the same file to Canvas by no later than the specified time. Please ensure that you allow enough time for your files to upload.

Students will be presenting their final design in their tutorial groups in week 12.

Files are to be named as follows:

AAT2026_AT3_TUTORS LAST NAME_Student Number_Student First and Last Name

Please note the title case that you are to write the file name in.

All files are to be submitted in PDF format.

Your drawing package will need to include a Revit Revision for the Schematic Design, Design Development and Final Presentation deadlines including a Revision number, date and description as per the example below:

Revision	Date	Description
1	dd/mm/yyyy	Project Portfolio Issue

Along with your drawing set you will need to include a completed Document Transmittal, see the link below. Each drawing listed in the transmittal should have a revision number corresponding to the relevant stage of work (ie. SD, DD, PP). Submit an A4 pdf of the Document Transmittal with your drawing set.

[RMIT AAT Drawing List + Transmittal.xlsx](#) 

See an example below of how to complete the Drawing Transmittal:

REASON FOR ISSUE: SD - Schematic Design DD - Design Development PP - Project Portfolio			SD	DD	PP
SENT BY:					
C - courier, D - Dropbox, E - email, H - hand, M - mail, P - pick up, C - canvas			C	C	C
FORMAT:					
CD, PDF, R - Revit Model, P - print, UL - Upload to site			PDF	PDF	PDF
			DAY

			MONTH		
			3	4	5
			YEAR		
			2026	2026	2026
			STAGE	STAGE	STAGE
DRAWING #	ARCHITECTURAL	SCALE	SD	DD	PP
A000	TITLE SHEET	N/A	1	2	3
A001	SITE PLAN	1:200	1	2	3
A100	BASEMENT PLAN (if required)	1:100	1	2	3
A101	GROUND FLOOR PLAN	1:100	1	2	3
A102	TYPICAL UNIT LOWER-LEVEL FLOOR PLAN	1:100	1	2	3
A103	TYPICAL UNIT UPPER-LEVEL FLOOR PLAN	1:100		2	3
A104	ROOF PLAN	1:100		2	3

You will be presenting your projects electronically on the class room COW.

Your group work will be reviewed and graded at the final presentation.

Students are to submit their final portfolio by no later than 5pm on Friday of Week 12.

ATTENDANCE AND ACADEMIC INTEGRITY

The course upholds academic integrity through the in person tutorial teaching model.

Students are advised that attendance, while not a graded component, is crucial for demonstrating work in progress and supporting their claim to have exercised critical judgment. This criterion contributes to the assessment grade. Failure to provide sufficient evidence of work in progress, complete all tasks, attend presentations, and submit work for assessment and grade moderation may impact the individual assessment grades and, consequently, the overall course grade. Incomplete or poorly considered work that does not meet the course objectives may also negatively affect the grade. Crucially, successful assessment outcomes are the result of continuous dialogue with tutors and peers. Students with 3 or more absences face a higher risk of academic failure.

Students are advised that it is their responsibility to obtain sufficient feedback from their tutors. If they are uncertain, they should seek clarification from staff on any issues related to the standard of their work

FEEDBACK AND GRADES

Written feedback will be provided 7 days after mid semester reviews has taken place.

RMIT ELECTRONIC SUBMISSION OF WORK FOR ASSESSMENT

I declare that in submitting all work for this assessment I have read, understood and agree to the content and expectations of the [assessment declaration \(Links to an external site.\)](#) .

Criteria	Ratings				
PC39 - Understand how the integration of material selection, structural and construction systems impacts on design outcomes.	1. Fail The project demonstrates an insufficient understanding of how the integration of material selection, structural and construction systems impacts on design outcomes.	2. Pass The project demonstrates a sufficient understanding of how the integration of material selection, structural and construction systems impacts on design outcomes.	3. Credit The project demonstrates a basic understanding of how the integration of material selection, structural and construction systems impacts on design outcomes.	4. Distinction The project demonstrates a good understanding of how the integration of material selection, structural and construction systems impacts on design outcomes.	5. High Distinction The project demonstrates a high degree of understanding of how the integration of material selection, structural and construction systems impacts on design outcomes.
PC40 - Be able to resolve and present a coherent detailed design solution within necessary timeframes to obtain client and stakeholder approvals.	1. Fail The project demonstrates an insufficient ability to resolve and present a coherent detailed design solution within necessary timeframes to obtain client and stakeholder approvals.	2. Pass The project demonstrates a sufficient ability to resolve and present a coherent detailed design solution within necessary timeframes to obtain client and stakeholder approvals.	3. Credit The project demonstrates a basic ability to resolve and present a coherent detailed design solution within necessary timeframes to obtain client and stakeholder approvals.	4. Distinction The project demonstrates a good ability to resolve and present a coherent detailed design solution within necessary timeframes to obtain client and stakeholder approvals.	5. High Distinction The project demonstrates a high degree of ability to resolve and present a coherent detailed design solution within necessary timeframes to obtain client and stakeholder approvals.
PC44 - Understand the roles and types of relevant consultants and suppliers as well as applicable construction	1. Fail The project demonstrates an insufficient understanding of the roles and types of relevant consultants and suppliers as	2. Pass The project demonstrates a sufficient understanding of the roles and types of relevant consultants and suppliers as	3. Credit The project demonstrates a basic understanding of the roles and types of relevant consultants and suppliers as	4.
